

Unsupervised Anomaly Detection in Digital Pathology Images

Ahmed Serag, Ph.D.

Digital & Computational Pathology

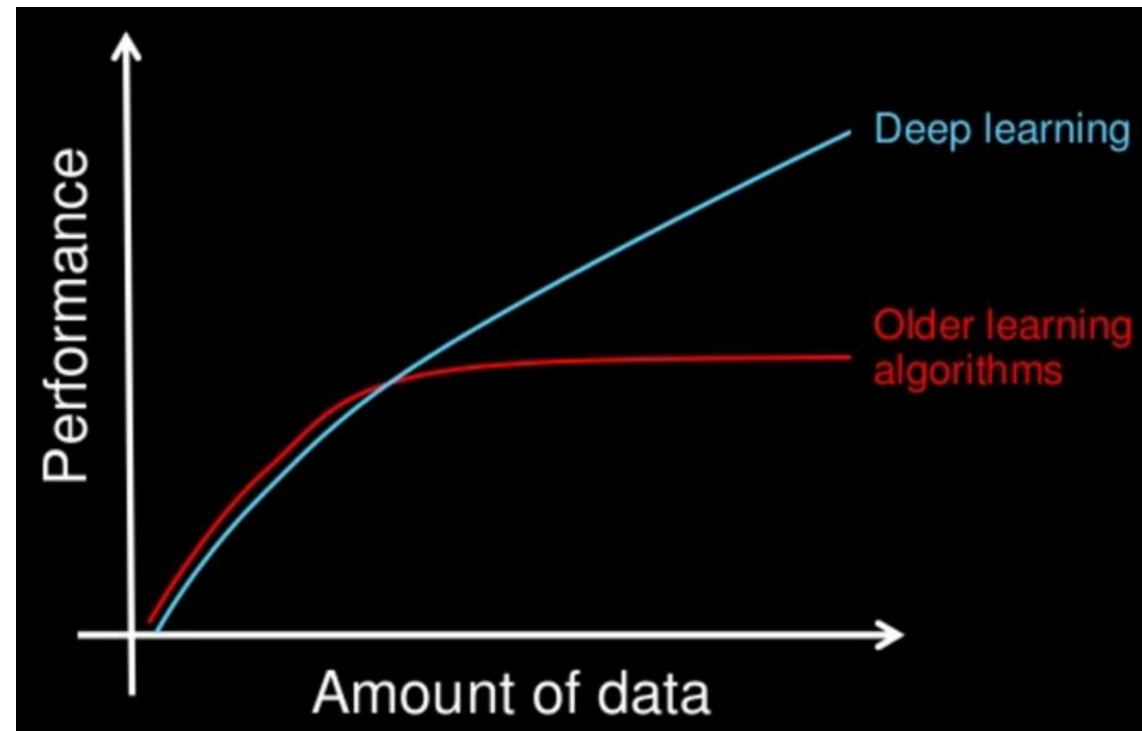

08/09/2019

Agenda

- Background
- Aim
- Approach
- Results
- Conclusion

Background

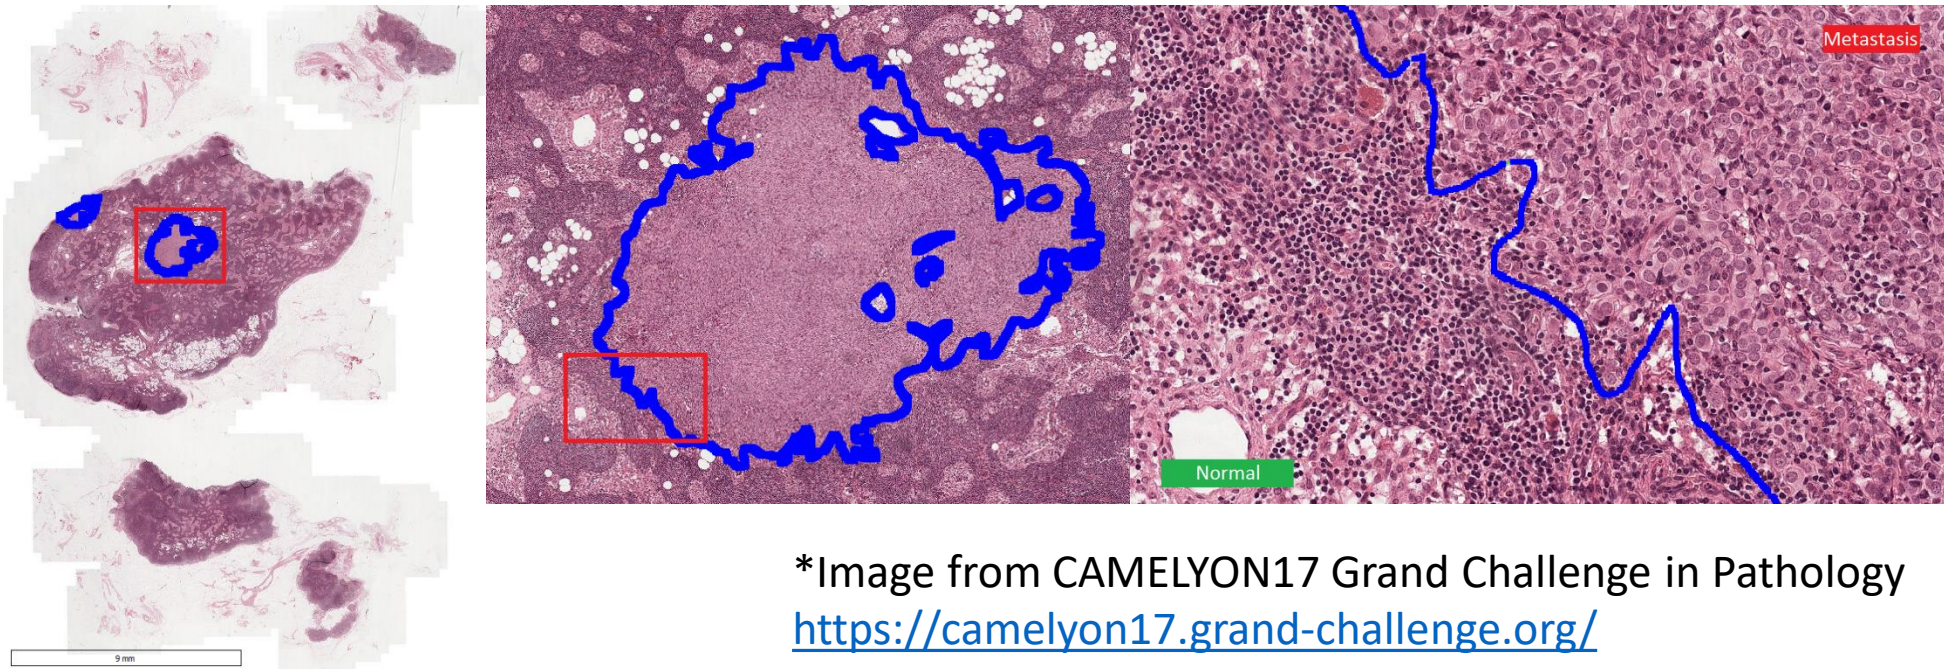

The building of deep learning models needs large amounts of data with annotated examples.

* Slide by *Andrew Ng*, all rights reserved.

Background

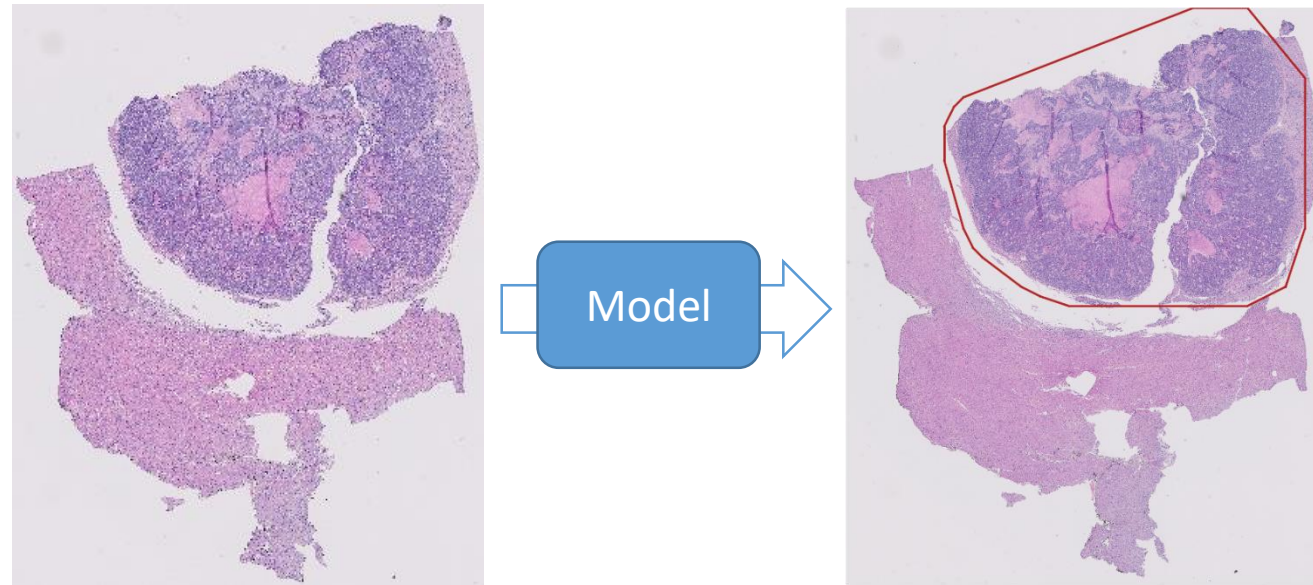

Obtaining expert labels for training deep learning models is difficult.

Aim

Build an **unsupervised learning** approach capable of identifying anomalous patterns for automated detection in diagnostics.

Generative Adversarial Networks (GANs)

Goodfellow et al., NIPS, 2014

Applications

Image generation

Impressive text to image results

This small blue bird has a short pointy beak and brown on its wings

This bird is completely red with black wings and pointy beak

A small sized bird that has a cream belly and a short pointed bill

A small bird with a black head and wings and features grey wings

Image inpainting

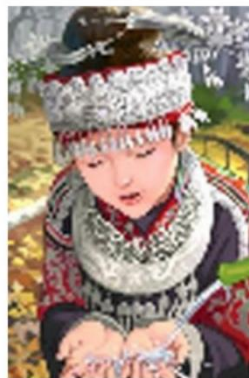

Input to GAN

GAN generated output

Image super resolution using SRGANs

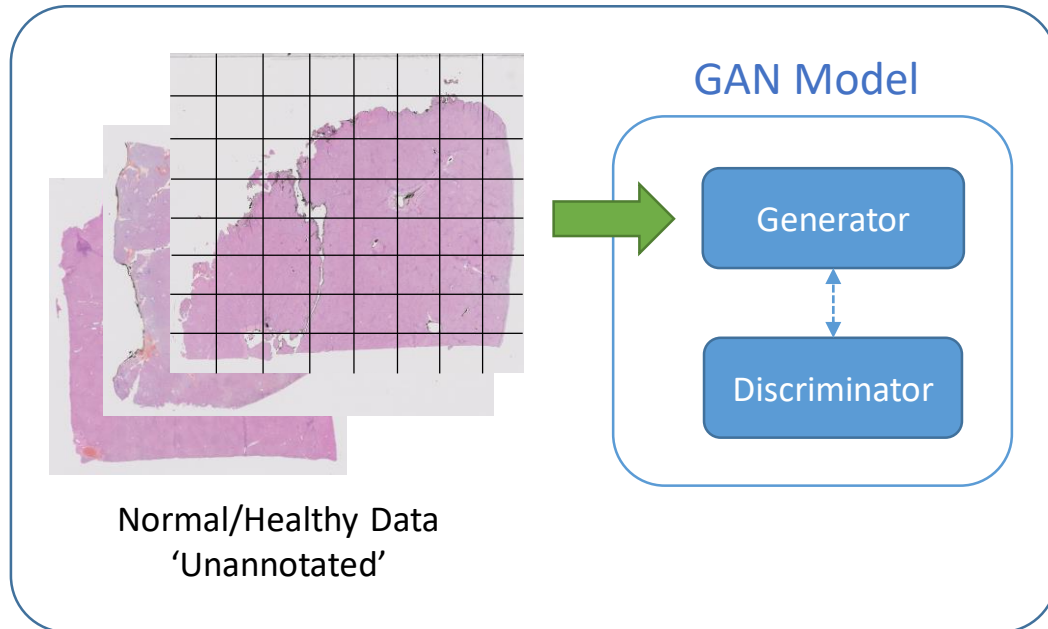

GANs and unsupervised learning techniques for anomaly detection in medical images

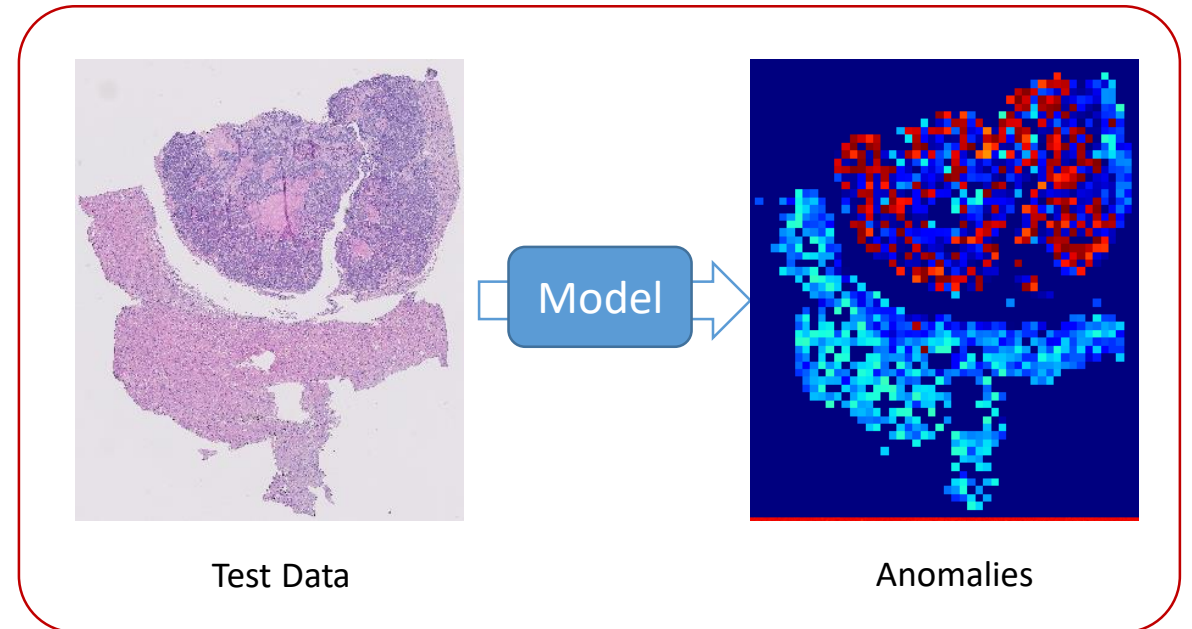

- Erfani et al. High dimensional and large-scale anomaly detection using a linear one-class SVM with deep learning. Pattern Recognit., 2016.
- Schlegl et al. Unsupervised Anomaly Detection with Generative Adversarial Networks to Guide Marker Discovery. IPMI, 2017.
- Akcay et al. GANomaly: Semi-Supervised Anomaly Detection via Adversarial Training. ACCV, 2018.
- Campanella et al. Clinical-grade computational pathology using weakly supervised deep learning on whole slide images. Nat. Med., 2019.

Anomaly Detection using GANs

Training

Identifying anomalies

Serag et al., Front. Med. - Pathology, 2019

Anomaly Score

Anomaly Score is based on residual and discrimination losses:

- **Residual loss $R(\mathbf{x})$:** L1 distance between generated image and unseen test image.
- **Discrimination loss $D(\mathbf{x})$:** L1 distance between feature representations of generated and test image.

$$A(\mathbf{x}) = (1 - \lambda) \cdot R(\mathbf{x}) + \lambda \cdot D(\mathbf{x})$$

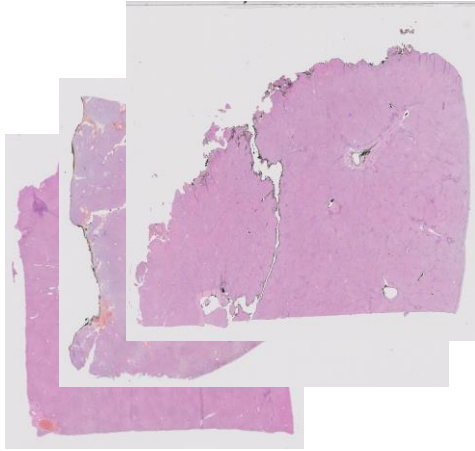

Schlegl et al., IPMI, 2017

Results

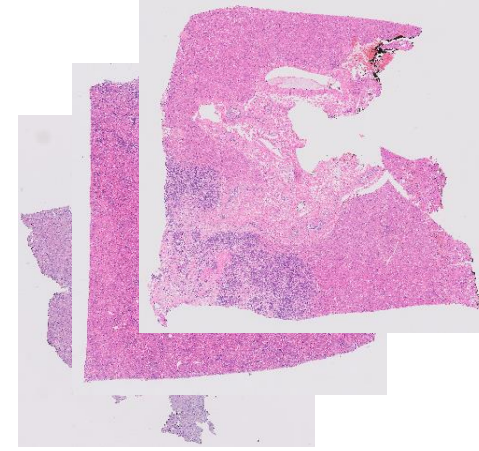

These slides detail early-stage internal research projects and intermediate output and do not make any claims pertaining to current Philips products.

Liver metastasis from colon

50 slides of routinely taken section of macroscopically normal Liver.

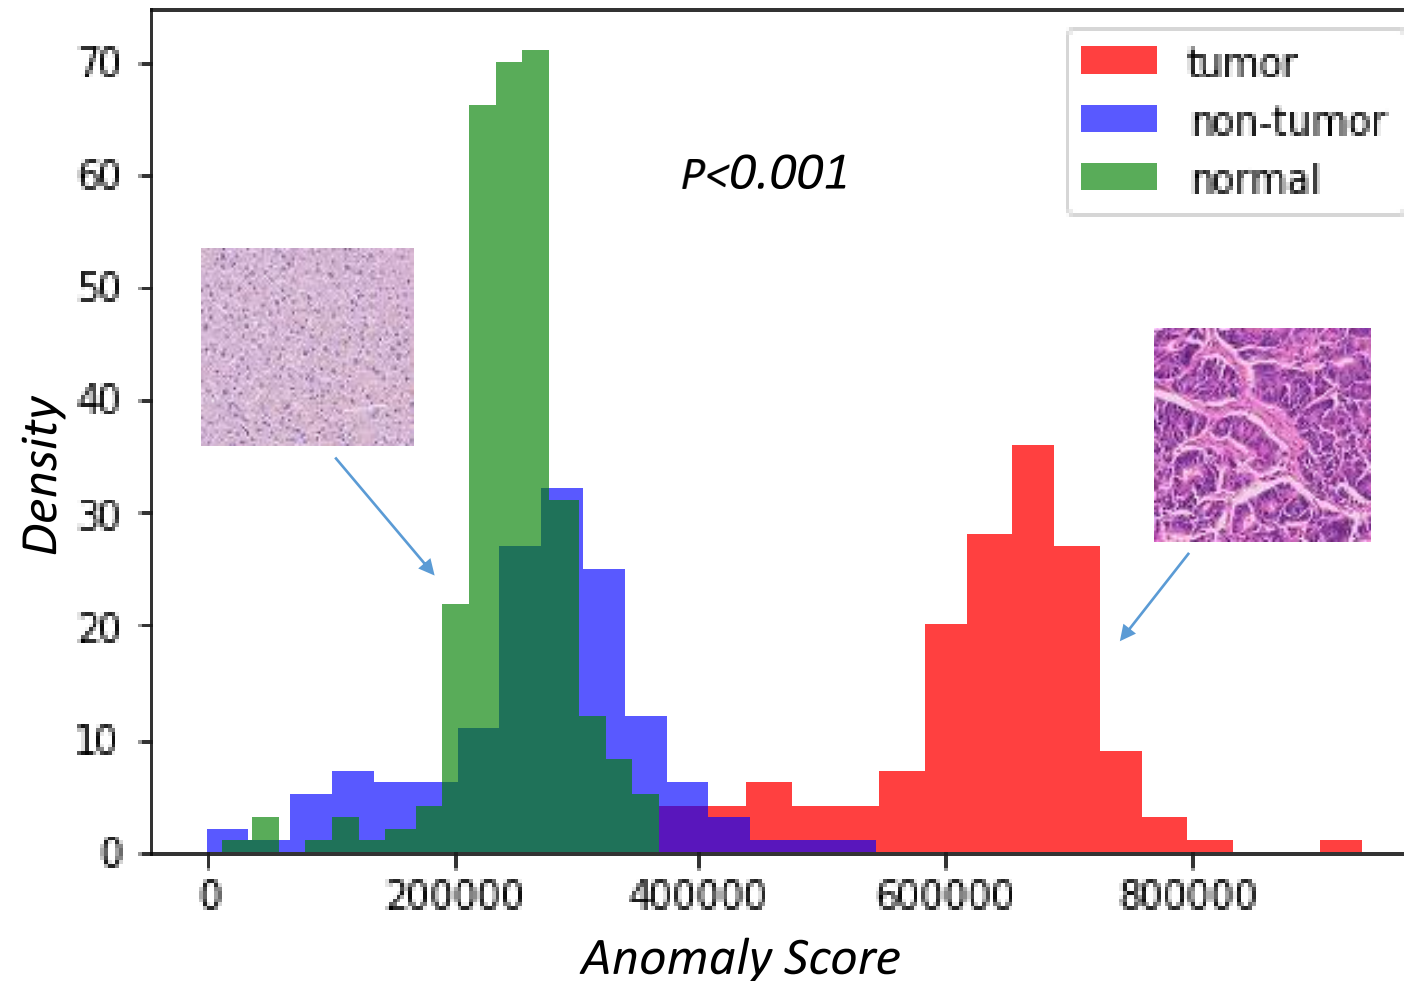

100 H&E stained WSIs

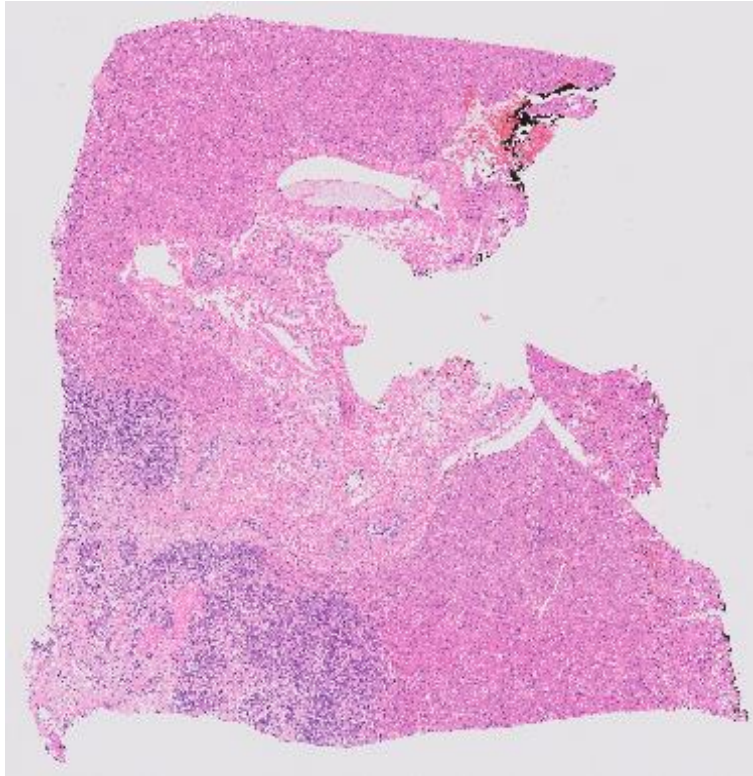

50 slides of liver metastasis from colon.

- 64x64px patches were extracted at 2.5x (4MPP).
- For training: 43K patches from 40 non-tumor liver slides used (**No Annotations Needed**)
- For testing: 10k patches extracted from the remaining 10 non-tumor slides used.
- All 50 slides with metastasis used for testing.

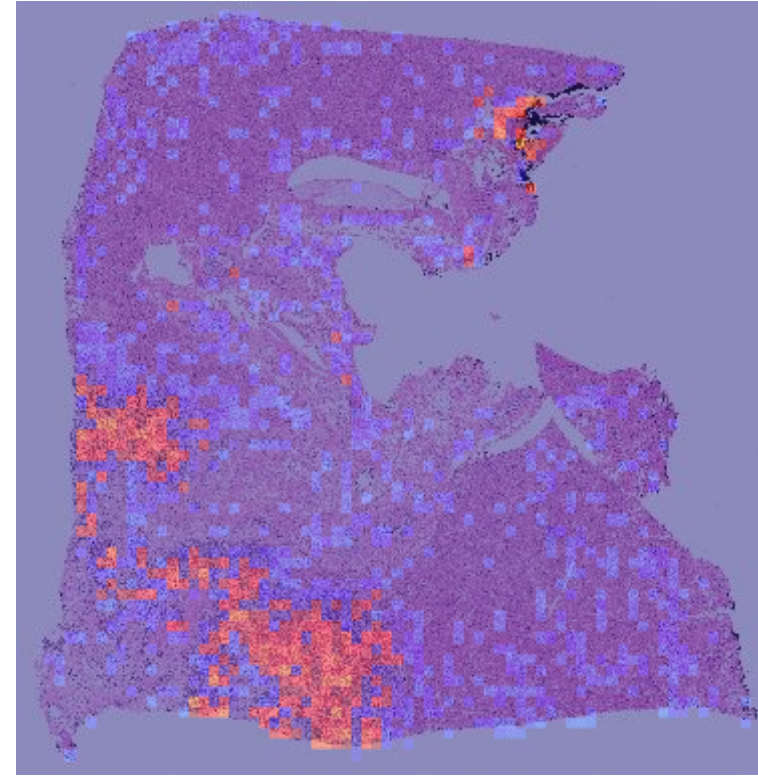

Results – Distribution of anomaly scores

Results – WSI processing

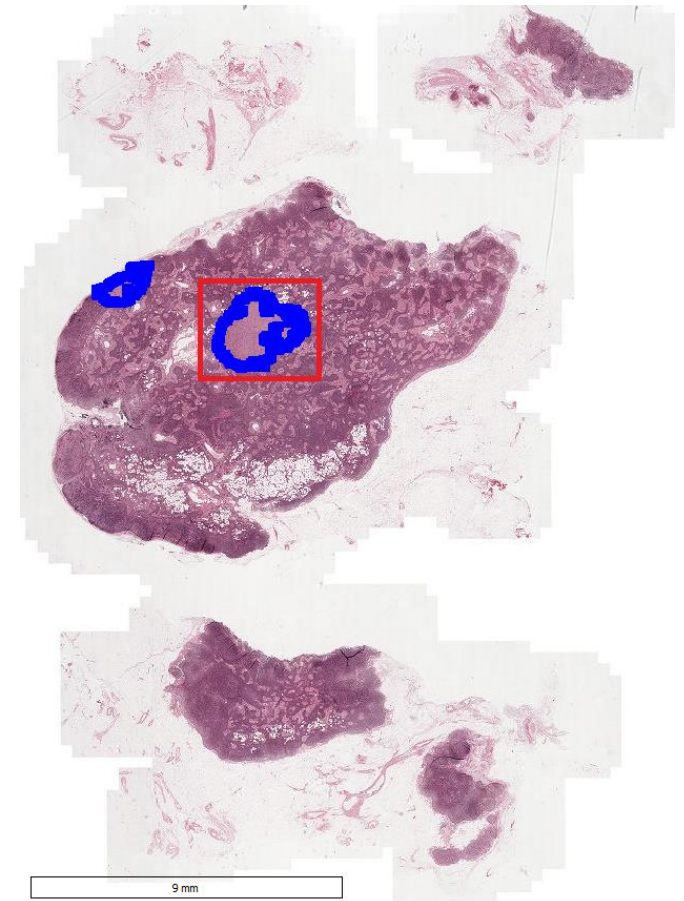

Slide

Slide with overlaid anomaly heat map

Breast lymph nodes metastasis

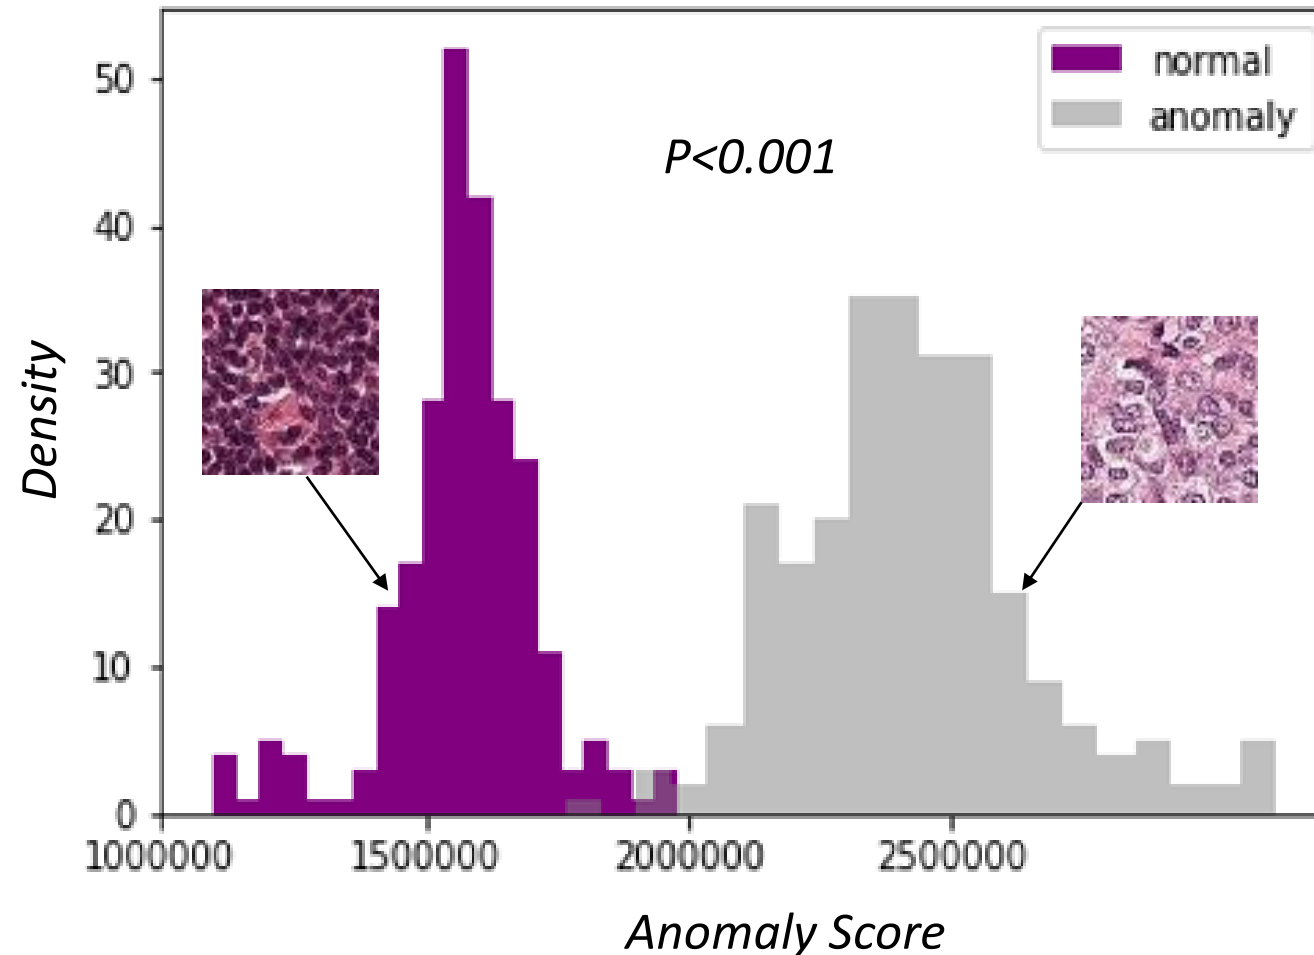

- Images from CAMELYON17* Grand Challenge used to test the scalability of the approach to higher resolution
- 64x64px patches were extracted at 10x.
- For training: 50K patches from 70 non-tumor slides used.
- For testing: 750 patches extracted from 10 slides (5 non-tumor and 5 tumor) used.

*Litjens et al., *GigaScience*, 2018

<https://camelyon17.grand-challenge.org/>

Results – Distribution of anomaly scores

Conclusion

- We proposed an unsupervised learning approach capable of identifying anomalous patterns for automated detection in diagnostics.
- The approach was successfully applied for metastasis detection in liver biopsies and breast lymph nodes.
- Training patches were extracted from non-tumor images; avoiding the necessity of having detailed pathologist annotation.
- The approach may lead to substantial cost-reduction and time-saving in developing automated tools.
