Concept of liquid biopsy

- Non-invasive approach
- Potential replacement of tissue
- In oncology:
 - Broad range of the malignancy's properties
 - Reflecting the intra-tumor heterogeneity

Background data

Gut. 2010 Sep;59(9):1178-83. doi: 10.1136/gut.2010.210609. Epub 2010 Jun 28.

Polycyclic aromatic hydrocarbon exposure in oesophageal tissue and risk of oesophageal squamous cell carcinoma in north-eastern Iran.

Abedi-Ardekani B¹, Kamangar F, Hewitt SM, Hainaut P, Sotoudeh M, Abnet CC, Taylor PR, Boffetta P, Malekzadeh R, Dawsey SM.

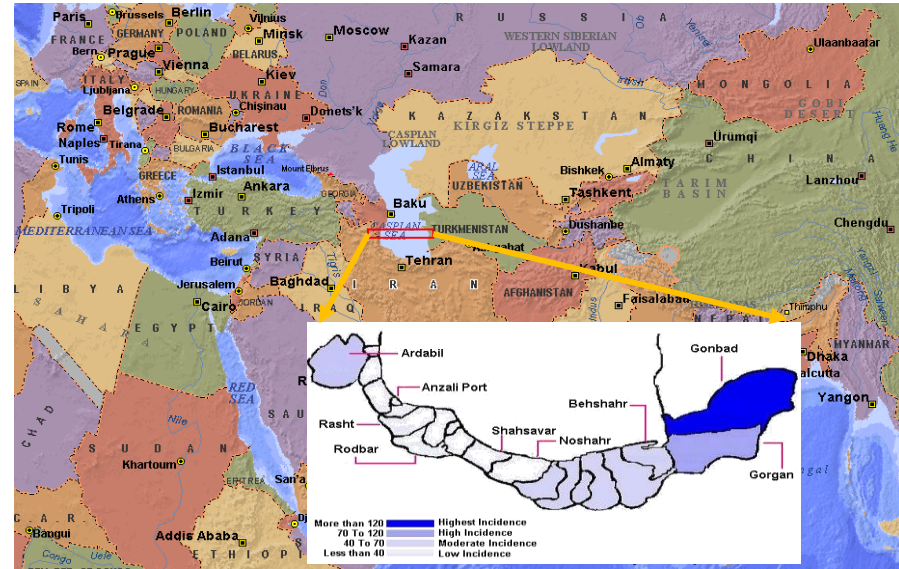

Author information

PLoS One. 2011;6(12):e29488. doi: 10.1371/journal.pone.0029488. Epub 2011 Dec 27.

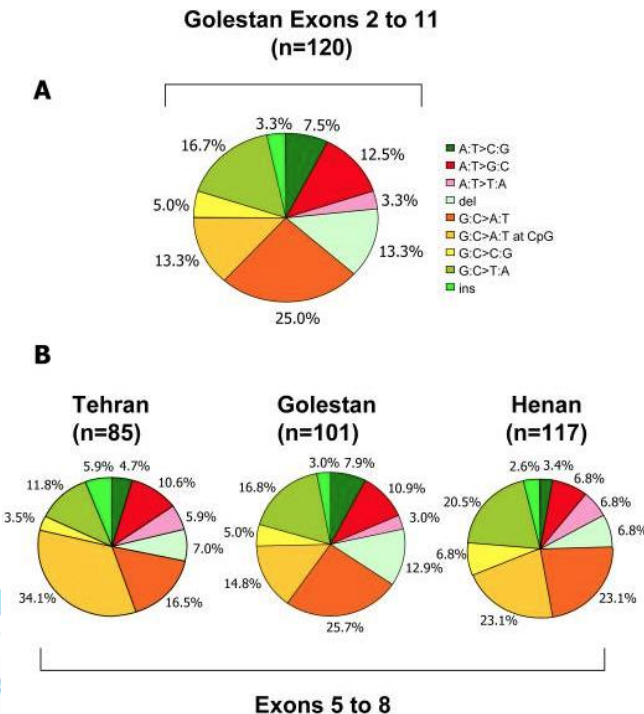

Extremely high Tp53 mutation load in esophageal squamous cell carcinoma in Golestan Province, Iran.

Abedi-Ardekani B¹, Kamangar F, Sotoudeh M, Villar S, Islami F, Aghcheli K, Nasrollahzadeh D, Taghavi N, Dawsey SM, Abnet CC, Hewitt SM, Fahimi S, Saidi F, Brennan P, Boffetta P, Malekzadeh R, Hainaut P.

Author information

ASR=70 of ESCC in the Eastern part of the Golestan Province

- TP53 Mutation rate of 90%
- The most common mutation type: G:C to A:T transitions (38.3%)
- G:C to T:A transversions as the second common type (16.7%)

Main Study

- Identification of tumor mutations in ESCC cases occurring during follow up of Golestan Cohort
- Searching the same mutations in CfDNA in plasma at the time of diagnosis of malignancy
- Searching the same mutations in CfDNA in plasma at the time of recruitment in cohort

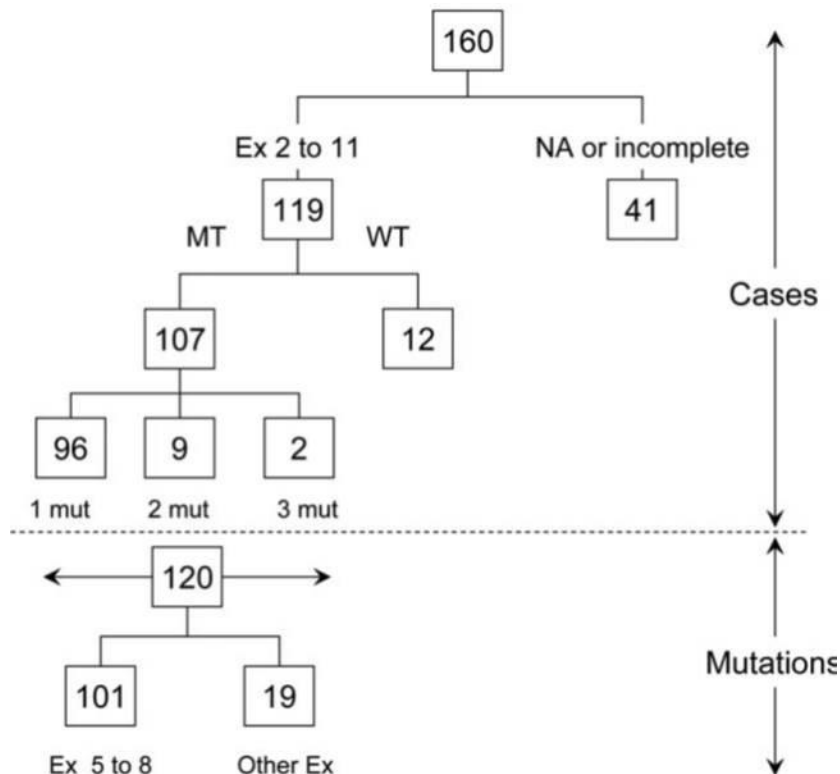

Proof-of-Principle

PLoS One. 2011;6(12):e29488. doi: 10.1371/journal.pone.0029488. Epub 2011 Dec 27.

Extremely high *Tp53* mutation load in esophageal squamous cell carcinoma in Golestan Province, Iran.

Abedi-Ardekani B¹, Kamangar F, Sotoudeh M, Villar S, Islami F, Aghchell K, Nasrollahzadeh D, Taghavi N, Dawsey SM, Abnet CC, Hewitt SM, Fahimi S, Saidi F, Brennan P, Boffetta P, Malekzadeh R, Hainaut P.

- To examine if known *TP53* mutations in the ESCC cases can be detected in cfDNA from the serum of the same patients

Comparison of pre-analytical recommendations and our archived samples

| Recommended | Status of our study samples |
|---|--------------------------------|
| Plasma – 1 ml | Serum <0.8 ml (mean 0.5 ml) |
| Single freeze-thaw cycle | Multiple freeze-thaw cycles >3 |
| Proceed within 6-hours after phlebotomy | Varied |
| Storage at -80 | A year of storage at -20 |

VOLUME 36 • NUMBER 12 • JUNE 1, 2018

CfDNA concentration of
2.1 to 2.2 ng/ul

International Agency for Research on Cancer

Study design

- Unavailable data on the allelic fraction of tissue mutations
- In-silico selection : positions with low error in sequencing
 - 40 ESCC cases
 - 39 matched controls (age, gender, and residence)
 - To help improving pipeline's calculation of estimates

Sequencing method

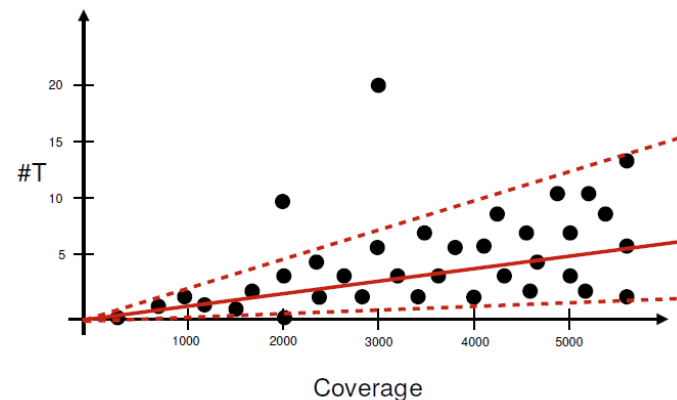

- 27 primers covering *TP53* exons and splicing sites were designed and pooled.
- Each sample in duplicate
- Modified GeneRead to amplify *TP53* coding areas
- One pool instead of 4 pools (due to low cfDNA level)
- Libraries at the size of 200-300 bp, Ion-Torrent platform

Needlestack pipeline- variant caller

- For each position/alteration, regression line of coverage and number of alternative determine outliers
- Duplicates to distinguish between sequencing errors and real variants

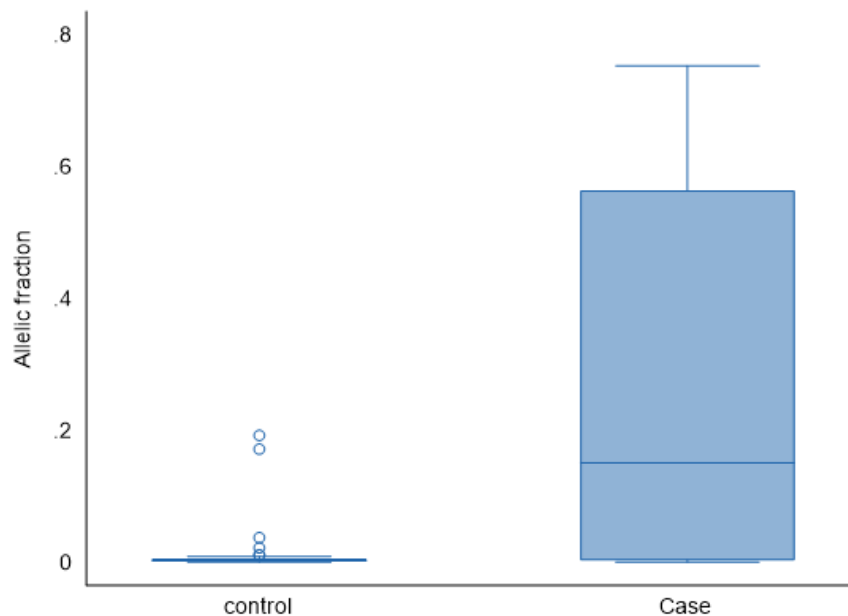

<https://github.com/IARCbioinfo/needlestack>

All mutations

| CtDNA Status | Case | Control |
|-------------------------|-------|---------|
| cfDNA mutation | 23/40 | 25/39 |
| No of mutations | 49 | 55 |
| Putative effect scoring | 1.47 | 1.23 |

Comparison with other studies

| Published in | Year | Tumor type | Sample type | Sample volume (ml) | mutation in <i>TP53</i> cfDNA / tumor (%) |
|---------------|-------|------------|-------------|--------------------|---|
| Science | 2018 | ESCC | Plasma | 7 – 7.5 | 9/40 (22.5%) |
| Oncotarget | 2017 | HNSCC | Plasma | 0.6 - 2.1 | 13/45 (29%) |
| Current study | ----- | ESCC | Serum | 0.5 - 1 | 9/50 (20%) |

*Using duplicate filters will decrease number of reads from 8390 libraries to 220.

Conclusion and future plan

- *Low-volume, low-quality* archived *serum* samples can be used for CfDNA extraction and mutation detection
- Our laboratory method in combination of IARC call variant pipeline rendered comparable results to highly cited recent publication
- Combination of different body fluids might improve the mutation detection rate
 - Capsule sponge wash and supernatants
 - Compare with concordant plasma
